PRP Therapy (AKA “Vampire Facial”)

Information for Patients

PRP Therapy (which stands for Platelet-Rich Plasma Therapy) involves blood being taken from the your own body, put in a machine that separates the blood cells, serum and platelets which are then injected directly back into the face or the area of the body in need of rejuvenation.

It is recommended for anyone who prefers a more natural approach to anti-ageing treatments as it is directly derived from your own blood.

What are the benefits of treatment?

PRP therapy uses your own natural growth factors to stimulate new tissue growth to repair and restore tissues. It will reduce wrinkles, lines and naturally improves the overall skin tone.

What is involved in the procedure?

The preparation involves the withdrawal of a small quantity of your blood, separating and concentrating the PRP and then injecting into the treatment area

Are there any side effects?

Because you are using your own blood, no foreign or synthetic substance is used and therefore the possibility of any side effects are minimal. The injection process itself may cause mild bruising and redness
